INTRODUCTION

This is the fifty-seventh annual report of the U.S. International Trade Commission (formerly the U.S. Tariff Commission) on domestic production and sales of synthetic organic chemicals and the raw materials from which they are made. It is authorized under the provisions of section 332 of the Tariff Act of 1930, as amended. The report consists of fourteen sections, each covering a specified group (based principally on use) of organic chemicals as follows: Tar and tar crudes; crude products from petroleum and natural gas; intermediates; dyes; pigments; medicinal chemicals; flavor and perfume materials; plastics and resin materials; rubber-processing chemicals; elastomers; plasticizers; surface-active agents; pesticides and related products; and miscellaneous organic chemicals. Data have been supplied by approximately 800 producers.

The first table in each section gives statistics on products and groups of products in as great detail as is possible without revealing the operations of individual producers. Statistics for an individual chemical or group of chemicals are given only when there are three or more producers, no one or two of which may be predominant. Moreover, even when there are three or more producers, statistics are not given if there is any possibility that their publication would violate the statutory provisions relating to unlawful disclosure of information accepted in confidence by the Commission. [1]

Data are reported by producers for only those items where the volume of production or sales exceeds 1,000 pounds or the value of sales exceeds $1,000. They are usually given in terms of undiluted materials; however, products of 95 percent or more purity are considered to be 100 percent pure. Commercial concentrations are applied to dyes, certain plastics and resins, and a few solvents; such concentrations are specifically noted.

The statistics given in this report include data from all known domestic producers of the items covered and include the total output of each company's plants, i.e., the quantities produced for consumption within the producing plant, as well as the quantities produced for domestic and foreign sale. The quantities reported as produced, therefore, generally exceed the quantities reported as sold. Some of these differences, however, are attributable to changes in inventory.

The second table in each section lists all items for which data on production or sales have been reported, by primary manufacturers, identified by manufacturers' codes. Each code consists of not more than three capital letters which is assigned on a permanent basis. The third table in each section is a directory, alphabetized by the codes of the manufacturers reporting in that section. Table 1 of the Appendix is a directory, alphabetized by the names of the manufacturers reporting in all sections and includes their office addresses.

Information on the synonymous names of the organic chemicals included in this report may be found in the *SOCMA Handbook: Commercial Organic Chemical Names*, published by the Chemical Abstracts Service of the American Chemical Society, or the *Colour Index* (2d edition), published by the Society of Dyers and Colourists.

Table 2 of the Appendix summarizes and gives the competitive status of U.S. general imports in 1973 of benzenoid intermediates and finished benzenoid products, entered under schedule 4, parts 1B and 1C, of the Tariff Schedules of the United States.

As specified in the reporting instructions sent to manufacturers, production and sales (unless otherwise specified) are defined as follows:

> *PRODUCTION is the total quantity of a commodity made available by original manufacturers only. It is the sum--expressed in terms of 100% active ingredient unless otherwise specified in the reporting instructions--of the quantities:*
>
> *Produced, separated, and consumed in the same plant or establishment. A commodity is considered separated when it is isolated from the reaction system and/or when it is weighed, analyzed, or otherwise measured. This includes byproducts and coproducts that are not classifiable as waste materials;*
>
> *Produced and transferred to other plants or establishments of the same firm;*
>
> *Produced and sold to other firms, including production for another under a toll agreement (i.e., an agreement, under which one firm furnishes the raw materials and pays the processing costs and the other firm prepares the finished product and returns it to the first firm).*
>
> *Produced and held in stock.*

[1] Title 18, U.S.C. 1905 and Title 44, U.S.C. 3508

PRODUCTION EXCLUDES:

Purification of a commodity, unless inclusion of such processing is specifically requested in the reporting instructions for individual sections;
Intermediate products which are formed in the manufacturing process, but are not isolated from the reaction system--that is, not weighed, analyzed, or otherwise measured;
Materials that are used in the process but which are recovered for re-use or sale;
Waste products having no economic significance.

SALES are actual quantities of commodities sold by ORIGINAL MANUFACTURERS ONLY. Sales include the quantity and value of:
Shipments of a commodity for domestic use and for export, or segregation in a warehouse when title has passed to the purchaser in a bona fide sale;
Shipments of a commodity produced by others under toll agreements;
Shipments to subsidiary or affiliated companies.

SALES EXCLUDE:
All intra-company transfers within a corporate entity;
All sales of purchased commodities;
All shipments of a commodity produced for others under toll agreements.

VALUE OF SALES is the net selling value f.o.b. plant or warehouse, or delivered value, whichever represents the normal industry practice.

Combined production of all synthetic organic chemicals, tars, tar crudes, and crude products from petroleum and natural gas in 1973 was 286,092 million pounds--an increase of 7.4 percent over the output in 1972 (see table 1). Sales of these materials in 1973, which totaled 164,312 million pounds valued at $19,260 million, were 8.9 percent larger than in 1972 in terms of quantity and 20.2 percent larger in terms of value. These figures include data on production and sales of chemicals measured at several successive steps in the manufacturing process, and therefore they necessarily reflect some duplication.

In 1973, production of all synthetic organic chemicals, including cyclic intermediates and finished chemical products, totaled 179,717 million pounds, or 9.4 percent more than the output in 1972. Production increased in 1973 compared to 1972 for all subgroups of products except one. Among the groups with large volumes of production, elastomers (synthetic rubbers) (5,990 million pounds) lead with an increase of 21.9 percent and plastics and resins materials (30,251 million pounds) followed with an increase of 16.7 percent. Other groups in the large volume production category increased as follows: Pesticides and related products (1,289 million pounds) and rubber processing chemicals (401 million pounds) both rose by 11 percent, and plasticizers and miscellaneous chemicals increased by slightly less than 10 percent. Medicinal chemicals (234 million pounds), fell 0.3 percent below the 1972 production level.

GENERAL

In this report, synthetic organic chemicals are classified on the basis of their principal use as follows: cyclic intermediates, dyes, organic pigments, medicinal chemicals, flavor and perfume materials, plastics and resin materials, rubber-processing materials, elastomers, plasticizers, surface-active agents, pesticides and related products and miscellaneous chemicals (acyclic intermediates and acyclic and cyclic finished products). Most of these groups are further subdivided either by use or by chemical composition. As intermediate chemicals are used in the manufacture of finished products, aggregate figures that cover both intermediates and finished products necessarily include considerable duplication.

Total production of synthetic organic chemicals (intermediates and finished products combined) in 1973 was 179,717 million pounds or 9.4 percent more than the output of 164,218 million pounds reported for 1972 and 71.6 percent more than the output of 104,711 million pounds reported for 1967 (see table 2). Sales of synthetic organic chemicals in 1973 amounted to 106,173 million pounds, valued at $17,638 million, compared with 94,205 million pounds, valued at $14,686 million in 1972 and 55,177 million pounds, valued at $10,438 million in 1967. Production of all cyclic products (intermediates and finished products combined) in 1973 totaled 57,513 million pounds or 7.2 percent more than the 53,637 million pounds reported for 1972 and 71.8 percent more than the 33,479 million pounds reported for 1967. Production of all acyclic products in 1973 totaled 122,204 million pounds, or 10.5 percent more than the 110,580 million pounds reported for 1972 and 71.6 percent more than the 71,232 million pounds reported for 1967.

Tar

Coal tar is produced chiefly by the steel industry as a byproduct of the manufacture of coke; water-gas tar and oil-gas tar are produced by the fuel-gas industry. Production of coal tar, therefore, depends on the demand for steel; production of water-gas tar and oil-gas tar reflects the consumption of manufactured gas for industrial and household use. Water-gas and oil-gas tars have properties intermediate between those of petroleum asphalts and coal tars. Petroleum asphalts are not usually considered to be raw materials for chemicals.

The quantity of tar produced in the United States in 1973 was almost entirely coal tar which amounted to 732 million gallons (see table 1[1]). Production in 1973 was 2 percent less than the 747 million gallons of coal tar produced in 1972. Sales of coal tar in 1973 amounted to 336 million gallons, valued at $42 million, compared with 341 million gallons, valued at $40 million, in 1972. U.S. production of water-gas and oil-gas tars was not reported to the Commission for 1972 or 1973; production of these tars in 1968 amounted to 21 million gallons, according to trade publications.

Consumption of tar in 1973 amounted to an estimated 721 million gallons, of which 77 percent was consumed in distillation. Estimates of tar used by the producers as fuel amounted to 140 million gallons; a lesser amount, 3.0 million gallons, was consumed by coke-oven operators in miscellaneous uses (see table 1A).

Tar Crudes

Tar crudes are obtained from coke-oven gas and by distilling coal tar, water-gas tar, and oil-gas tar. The most important tar crudes are benzene, toluene, xylene, creosote oil, and pitch of tar. Some of these products are identical with those obtained from petroleum. Data for materials obtained from petroleum are included, for the most part, with the statistics for like materials obtained from coke-oven gas and tars, and are shown in table 1 and 1B.

Domestic production of industrial and specification grades of benzene reported by coke-oven operators and petroleum refinery operators[2] in 1973 amounted to 1,453 million gallons--16.1 percent more than the

[2] Statistics on production and sales of benzene, toluene, and xylene by tar distillers cannot be shown because publication would reveal the operations of individual companies.

1252 million gallons reported for 1972. These statistics include data for benzene produced from light oil and petroleum. Sales of benzene by coke-oven operators and petroleum refiners in 1973 amounted to 719 million gallons, valued at $207 million, compared with 679 million gallons, valued at $138 million, in 1972. In 1973 the output of toluene[2] (including material produced for use in blending in aviation fuel) amounted to 958 million gallons--4.6 percent more than the 916 million gallons reported for 1972. Sales of toluene in 1973 were 513 million gallons, valued at $115 million, compared with 546 million gallons, valued at $92 million, in 1972. The output of xylene[2] in 1973 (including that produced for blending in motor fuels) was 785 million gallons, compared with 739 million gallons in 1972. Over 99 percent of the 785 million gallons of xylene produced in 1973 was obtained from petroleum sources.

Production (or sales) figures on crude naphthalene from coal-tar oils in 1973, could not be published without disclosing the operations of individual companies. Production of petroleum-derived naphthalene in 1973 amounted to 240 million pounds, compared with 231 million pounds in 1972. In 1973 the output of creosote oil for wood preservation was 111 million gallons (100 percent creosote basis), compared with 139 million gallons in 1972. Production figures on road tar for 1973 cannot be published; in 1972 production amounted to 30 million gallons.

Some of the products obtained from tar and included in the statistics in table 1 are obtained from other products for which data are also included in the table. The statistics, therefore, involve considerable duplication, and for this reason no group totals or grand totals are given. After duplication has been eliminated insofar as possible, the estimated net value of the output (from all sources) of these products and of tar burned as fuel was $962 million in 1973, compared with $698 million in 1972. The total value of sales of those products obtained from coke-oven gas and tars shown in table 1 (exclusive of coal tar itself), amounted to $128 million in 1973, compared with $126 million in 1972.

Data for 1973 tar crudes were supplied by 12 companies and company divisions.

See footnote 2 on page 1.

[1] Unit value per gallon, pound, or ton, as specified.

[2] Includes only data for coal tar reported to the Division of Fossil Fuels, U.S. Bureau of Mines. Data on U.S. production of water-gas tar and oil-gas tar are not collected by the International Trade Commission, but according to trade publications, production of these tars amounted to 21 million gallons in 1968.

[3] Data reported by tar distillers are not included because publication would disclose the operations of individual companies. Production of benzene, toluene, and xylene by tar distillers decreased in 1973, compared with 1972. The annual production statistics for petroleum refiners on benzene, toluene, and xylene are not comparable with the combined monthly production figures, because of fiscal year revisions.

[5] Statistics include data only for creosote oil sold for, or used in, wood preserving.
[6] In 1973, production of coal-tar solution containing creosote (100% solution basis) amounted to 38,388 thousand gallons; sales were 36,167 thousand gallons, valued at 6,960 thousand dollars, with a unit value of $0.193 per gallon.
[7] Includes data for crude sodium phenolate.
[8] Includes data for crude light oil, benzene, toluene, solvent naphtha, rubber-reclaiming oils, pyridine crude bases, crude tar-acid oils, crude cresylic acid, neutral oils, methylnaphthalene, crude tar for other uses, unspecified tar distillates, road tar, and a small amount of ethylbenzene. U.S. production and sales of two other distillates could not be published without disclosing the operations of individual companies; combined sales of crude naphthalene and soft pitch of tar in 1973 amounted to over $4.5 million.
[9] Includes hard pitch and pitch emulsion, along with a small amount of medium pitch produced by coke-oven operators.

Note.--Statistics for materials produced in coke and gas-retort ovens are compiled by the Division of Fossil Fuels, U.S. Bureau of Mines, Department of the Interior. Statistics for materials produced in tar and petroleum refineries are compiled by the U.S. International Trade Commission.

[1] Standard reference base period for Federal Government general-purpose index numbers.

[2] Includes only data for coal tar reported to the Division of Fossil Fuels, U.S. Bureau of Mines.

[3] Data reported by tar distillers are not included because publication would disclose the operations of individual companies.

[4] Includes data for material produced for use in blending motor fuels. Statistics are not comparable with monthly figures which included some o-xylene.

[5] Naphthalene solidifying at less than 79° C. Figures include production by tar distillers and coke-oven operators and represent combined data for the commercial grades of naphthalene. Because of conversion between grades, the figures may include some duplication. Statistics on naphthalene refined from domestic crudes are reported in the section on cyclic intermediates.

[6] Statistics on crude naphthalene cannot be published; to do so would disclose the operations of individual companies. Production of crude naphthalene in 1973, however, did not equal the low of 360 million pounds in 1971.

[7] Includes data for creosote oil produced by tar distillers and coke-oven operators and used only in wood perserving.

Crude Products From Petroleum and Natural Gas For Chemical Conversion

Crude products that are derived from petroleum and natural gas[1] are related to the intermediates and finished products made from such crudes in much the same way that crude products derived from the distillation of coal tar are related to their intermediates and finished products. Many of the crude products derived from petroleum are identical with those derived from coal tar (e.g., benzene, toluene, and xylene). Considerable duplication exists in the statistics on the production and sales of petroleum crudes because some of these crude chemicals are converted to other crude products derived from petroleum and because data on some production and sales are reported at successive stages in the conversion process. The statistics are sufficiently accurate, however, to indicate trends in the industry. Many of the crude products for which data are included in the statistics may be used either as fuel or as basic materials from which to derive other chemicals. In this report every effort has been made to exclude data on materials that are used as fuel; however, data are included on toluene and xylene which are used in blending aviation and motor fuel.

The output of crude products derived from petroleum and natural gas as a group amounted to 91,250 million pounds in 1973, or 5.1 percent more than the 86,792 million pounds reported for 1972 (table 1).[2] The larger output in 1973 is accounted for chiefly by increased production of ethylene, propylene and benzene. Sales of crude chemicals from petroleum in 1973 amounted to 49,625 million pounds, valued at $1,451 million, compared with 47,900 million pounds, valued at $1,177 million, in 1972.

The output of aromatic and naphthenic products from petroleum amounted to 24,774 million pounds in 1973 compared with 23,753 million pounds in 1972. Sales amounted to $458 million in 1973, and $351 million in 1972. The output of 1° and 2° benzene from petroleum in 1973 (10,009 million pounds) was 15.7 percent more than the 8,654 million pounds produced in 1972.

Production of all aliphatic hydrocarbons and derivatives from petroleum and natural gas was 66,475 million pounds in 1973, compared with 63,039 million pounds in 1972. Sales of these products were valued at $993 million in 1973 compared with $825 million in 1972. Production of ethylene was 22,329 million pounds in 1973--7.1 percent more than the 20,852 million pounds produced in 1972. The output of 1,3-butadiene in 1973 (3,644 million pounds) was the largest on record.

Data for 1973 crude products from petroleum and natural gas for chemical conversion was supplied by 74 companies and company divisions.

[2] The chemical raw materials designated as aromatics are in some cases identical with those obtained from the distillation of coal tar; however, the statistics given in the table above related only to such materials as are derived from petroleum and natural gas. Statistics on production or sales of benzene, toluene, and xylene from all sources are given in tables 1 and 1 8 of the report "Tar and Tar Crudes, 1973."

[3] Includes toluene and xylene used as solvents, as well as that which is blended in aviation and motor gasolines.

[4] Includes data for crude cresylic acid, alkyl aromatics, distillates, solvents, and miscellaneous cyclic hydrocarbons.

[5] Production figures on acetylene from calcium carbide for chemical synthesis are collected by the U.S. Bureau of the Census.

[6] Includes data for propane-propylene mixture.

[7] The statistics represent principally the butene content of crude refinery gases from which butadiene is manufactured.

Cyclic Intermediates

Cyclic intermediates are synthetic organic chemicals derived principally from petroleum and natural gas and from coal-tar crudes produced by destructive distillation (pyrolysis) of coal. Most cyclic intermediates are used in the manufacture of more advanced synthetic organic chemicals and finished products, such as dyes, medicinal chemicals, elastomers (synthetic rubbers), pesticides, and plastics and resin materials. Some intermediates, however, are sold as end products without further processing. For example, refined naphthalene may be used as a raw material in the manufacture of 2-naphthol or of other more advanced intermediates, or it may be packaged and sold as a moth repellent or as a deodorant. In 1973 about 50 percent of the total output of cyclic intermediates was sold; the rest was consumed chiefly by the producing plants in the manufacture of more advanced intermediates and finished products.

Total production of cyclic intermediates in 1973--35,863 million pounds--was the largest on record, and was 2.6 percent larger than the output of 34,967 million pounds reported for 1972. The larger output of cyclic intermediates in 1973 reflects the increased demand by the chemical products industries, particularly those industries that produce plastics materials, dyes, pigments, and plasticizers. Sales of cyclic intermediates in 1973 were 17,915 million pounds, valued at $1,899 million, compared with 16,196 million pounds, valued at $1,434 million, in 1972.

Production of styrene in 1973 was 5,975 million pounds, or 0.6 percent more than the 5,941 million pounds produced in 1972. Output of ethylbenzene was 5,688 million pounds, a small increase over the 5,676 million pounds produced in 1972. Other intermediates whose production exceeded 1 billion pounds in 1973 were cumene (2,665 million pounds), dimethyl terephthalate (2,564 million pounds), p-xylene (2,326 million pounds), phenol (2,276 million pounds), cyclohexane (2,123 million pounds), o-xylene (1,068 million pounds) and phthalic anhydride (1,023 million pounds). Other large volume intermediates produced in 1973 were isocyanates (871 million pounds), cyclohexanone (638 million pounds), straight-chain alkylbenzenes (498 million pounds), 2,4(and 2,6)-dinitrotoluenes (471 million pounds), aniline (458 million pounds), monochlorobenzene (397 million pounds), Bisphenol A (320 million pounds) and nitrobenzene (309 million pounds). The above 17 chemicals accounted for 83 percent of the total output of intermediates in 1973. Production of 12 of the above chemicals increased in 1973 compared with 1972. The output of five, however, decreased in 1973 from that in 1972, as follows: nitrobenzene (44 percent), cyclohexanone (18 percent), cyclohexane (8 percent), alkylbenzenes (5 percent), and monochlorobenzene (2 percent).

Dyes

Synthetic dyes are derived in whole or in part from cyclic intermediates. Approximately two-thirds of the dyes consumed in the United States are used by the textile industry to dye natural and synthetic fibers or fabrics; about one-sixth is used for coloring paper; and the rest is used chiefly in the production of organic pigments and in the dyeing of leather and plastics. Of the several thousand different synthetic dyes that are known, more than one thousand are manufactured by one or more domestic producers. The large number of dyes results from the many different types of materials to which dyes are applied, the different conditions of service for which dyes are required, and the costs that a particular use can bear. Dyes are sold as pastes, powders, lumps, and solutions; concentrations vary from 6 percent to 100 percent. The concentration, form, and purity of a dye are determined largely by the use for which it is intended.

Total domestic production of dyes in 1973 amounted to 284 million pounds, or 7.9 percent more than the 263 million pounds produced in 1972 (table 1).[1] Sales of dyes in 1973 amounted to 266 million pounds, valued at $519 million, compared with 255 million pounds, valued at $480 million, in 1972. In terms of quantity, sales of dyes in 1973 were 4.6 percent larger than in 1972 and in terms of value, 8.1 percent larger. The average unit value of sales of all dyes in 1973 was $1.95 per pound, compared with $1.88 per pound in 1972.

For many important dyes, production was larger in 1973 than in 1972. Vat Yellow 2 production increased 13.0 percent from 3,304,000 pounds in 1972 to 3,732,000 pounds in 1973. Disperse Yellow 3 production increased by 33.3 percent from 2,810,000 pounds in 1972 to 3,748,000 pounds in 1973. Other important dyes whose production in 1973 was substantially larger than in 1972 were Direct Yellow 11 (10.1 percent increase), Vat Black 25, 12-1/2%, (69.9 percent increase), Acid Blue 9 (39.2 percent increase), Vat Green 1, 6%, (15.4 percent increase), and Disperse Red 60 (10.9 percent increase).

On the other hand, the production of several important dyes was smaller in 1973 than in 1972. Production of Vat Blue 6, 8-1/3%, was 1,957,000 pounds in 1973, or 32.8 percent less than the 2,911,000 pounds produced in 1972. Production of Basic Yellow 11 was 1,661,000 pounds in 1973, or 2.8 percent less than the 1,708,000 pounds produced in 1972. The production of Vat Green 3, 10%, was 5.2 percent less in 1973 than in 1972; Fluorescent Brightening Agent 28 was 28.2 percent less; Direct Yellow 44 was 9.6 percent less; and Acid Red 88 was 13.9 percent less.

Table 1A is a summary of production and sales of dyes in 1973 by class of application. Five application classes of dyes accounted for 73.9 percent of all dyes produced in 1973. Vat dyes accounted for 19.8

[1] See also table 2 of this report which lists these products and identifies the manufacturers by codes. These codes are given in table 3.

percent of total production; disperse dyes for 17.6 percent; direct dyes for 13.8 percent; acid dyes for 11.3 percent; and fluorescent brighteners for 11.4 percent. Of these five classes of dyes, the production of vat dyes was 2.2 percent larger in 1973 than in 1972; the production of disperse dyes was 25.4 percent larger; the production of acid dyes was 7.7 percent larger; the production of direct dyes was 4.5 percent larger; and the production of fluorescent brighteners was 18.8 percent larger.

As compared with the 1972 data, the 1973 production of the remaining dye classes changed in the following manner: Basic dyes increased by 18.7 percent; fiber-reactive dyes decreased by 0.1 percent; food, drug, and cosmetic colors increased by 12.9 percent; and solvent dyes increased by 12.2 percent.

Organic Pigments

As the terms are used in this report, organic pigments are toners and lakes derived in whole or in part from benzenoid chemicals and colors.

Statistics on production and sales of all organic pigments in 1973 are given in table 1.[1] Statistics on sales of a few selected pigments by commercial forms (dry full-strength form, dry extended form, dry dispersions, aqueous dispersions, and flushed colors) are given in table 1A. Individual toners and lakes are identified in this report by the names used in the third edition of the Colour Index.

Total production of organic pigments in 1973 was 69.4 million pounds--5.3 percent more than the 65.9 million pounds produced in 1972 and 19.0 percent more than the 58.3 million pounds produced in 1971. Total sales of organic pigments in 1973 amounted to 61.5 million pounds, valued at $182.2 million, compared with 53.2 million pounds, valued at $149.3 million, in 1972 and 47.1 million pounds, valued at $130.0 million, in 1971. In terms of quantity, sales of organic pigments in 1973 were 15.5 percent greater than in 1972 and 30.6 percent greater than in 1971; in terms of value, sales in 1973 were 22.0 percent greater than in 1972 and 40.1 percent greater than in 1971.

Production of toners in 1973 amounted to 66.9 million pounds--6.5 percent more than the 62.9 million pounds reported for 1972. Sales in 1973 were 59.0 million pounds, valued at $178.6 million, compared with 50.5 million pounds, valued at $145.9 million, in 1972. Sales in 1973 were 16.8 percent more than those in 1972 in terms of quantity, and 22.4 percent more in terms of value. The individual toners listed in the report which were produced in the largest quantities in 1973 were Pigment Yellow 12, 8.4 million pounds; Pigment Blue 15, beta form, 6.3 million pounds; Pigment Blue 15, alpha form, 4.5 million pounds; and Pigment Red 49, barium toner, 4.4 million pounds.

Production of lakes totaled 2.4 million pounds in 1973--19.0 percent less than the 3.0 million pounds reported for 1972. Sales of lakes in 1973 amounted to 2.5 million pounds, valued at $3.6 million, compared with sales in 1972 of 2.7 million pounds, valued at $3.4 million. Sales in 1973 were 8.7 percent less than those in 1972 in terms of quantity, and 5.3 percent more in terms of value.

For each of 10 selected pigments, or groups of pigments, table 1A gives data on sales by commercial forms. Pigment Yellow 12 and Pigment Red 53 were sold principally in the flushed form. The remaining 8 pigments, or groups of pigments, for which statistics are published were sold principally in the dry full-strength form. Statistics on sales by commercial forms could not be published for Pigment Red 49, calcium toner, Pigment Red 49, sodium toner, Pigment Red 90, Pigment Violet 3, fugitive, Pigment Blue 19, and Pigment Blue 24, without revealing the operations of individual companies.

When the name of a color is enclosed in parentheses, it indicates that this name is that of the dye from which the pigment can be made and that no name for the pigment itself is given in the *Colour Index*.

The abbreviations PMA and PTA stand for phosphomolybdic and phosphotungstic (including phosphotungstomolybdic) acid, respectively.

Medicinal Chemicals

Medicinal chemicals include the medicinal and feed grades of all organic chemicals having therapeutic value, whether obtained by chemical synthesis, by fermentation, by extraction from naturally occurring plant or animal substances, or by refining a technical grade product. They include antibiotics and other anti-infective agents, antihistamines, autonomic drugs, cardiovascular agents, central nervous system depressants and stimulants, hormones and synthetic substitutes, vitamins, and other therapeutic agents for human or veterinary use and for animal feed supplements.

Table 1 shows statistics for production and sales of medicinal chemicals grouped by pharmacological class, while table 2 lists separately each product for which data were reported and identifies the manufacturers.[1] The statistics shown in table 1 are for bulk chemicals only; finished pharmaceutical preparations and products put up in pills, capsules, tablets, or other measured doses are excluded.[2] The difference between production and sales reflects inventory changes, processing losses, and captive consumption of medicinal chemicals processed into ethical and proprietary pharmaceutical products by the primary manufacturer. In some instances, the difference may also include quantities of medicinal grade products used as intermediates, e.g., penicillin G salts used as intermediates in the manufacture of semi-synthetic penicillins. All quantities are given in terms of 100-percent content of the pure bulk drug.

Total U.S. production of bulk medicinal chemicals in 1973 amounted to 233.6 million pounds, or 0.3 percent less than the 234.3 million pounds produced in 1972 and 4.6 percent more than the 223.2 million pounds produced in 1971. Total sales of bulk medicinal chemicals in 1973 amounted to 179 million pounds, valued at $582 million, compared with sales in 1972 of 163 million pounds, valued at $490 million, and sales in 1971 of 152 million pounds, valued at $487 million. In terms of quantity, sales in 1973 were thus 9.8 percent larger than in 1972 and 17.7 percent larger than in 1971. In terms of value, sales in 1973 were 18.8 percent larger than in 1972 and 19.7 percent larger than in 1971.

Production of the more important groups of medicinal chemicals in 1973 was as follows: Antibiotics, 20.8 million pounds (25.2 percent larger than in 1972), of which 12.6 million pounds was for medicinal use and 8.2 million pounds was for other uses; anti-infective agents other than

[1] See table 3 for a list of manufacturers and their identification codes.

[2] Complementary statistics on the dollar value of manufacturers' shipments of finished pharmaceutical preparations, except biologicals, are published annually by the U.S. Department of Commerce, Bureau of the Census, in Current Industrial Reports, Series MA-28G. Many pharmaceutical manufacturers who report to the Bureau of the Census are excluded from the Trade Commission report because they are not primary producers of medicinal chemicals, that is, they do not themselves produce the bulk drugs which go into their pharmaceutical products but purchase their drug requirements from domestic or foreign producers.

antibiotics, 33.2 million pounds (3.4 percent smaller than in 1972); central nervous system depressants and stimulants, 48.6 million pounds (7.2 percent smaller); and vitamins, 34.0 million pounds (13.3 percent larger).

Production of some of the more important individual products listed in table 1 was as follows: Choline chloride, 46.6 million pounds (14.4 percent smaller than in 1972); aspirin, 32.2 million pounds (8.2 percent smaller); ascorbic acid, 15.4 million pounds (25.2 percent larger); penicillins (except semi-synthetic), 4,945 trillion units (29.2 percent larger); tetracyclines, 2.3 million kilograms (28.3 percent larger); and vitamin E, 1,732 billion units (15.3 percent larger).

[1] The data on production and sales are for bulk medicinal chemicals only; they *exclude* finished preparations and dosage-form products, which are manufactured from bulk chemicals. All quantities are given in terms of 100% active ingredient.

[2] Calculated from rounded figures.

[3] The term "benzenoid," as used in this report, describes any cyclic medicinal chemical whose molecule contains either a six-membered carbocylic ring with conjugated double bonds (e.g., the benzene ring or the quinone ring) or a six-membered heterocyclic ring with 1 or 2 hetero atoms and conjugated double bonds, except the pyrimidine ring (e.g., the pyridine ring or the pyrazine ring.)

[4] Includes antibiotics of unknown structure.

[5] With the exception of bacitracin, the penicillins (except semisynthetic), and a few other antibiotics which were reported in terms of U.S.P. units, all quantities for antibiotics were reported as grams of antibiotic base. (Thus production of 480,900 grams of tetracycline hydrochloride, for example, would have been reported as 444,430 grams of tetracycline base.) For inclusion in the main statistical table, all quantities were converted from grams of antibiotic base to pounds of antibiotic base (453.6 grams = 1 pound) or from U.S.P. units to pounds (22.7 million units of bacitracin, 458 million units of procaine penicillin G, 723 million units of potassium penicillin G, etc. = 1 pound). The following tabulation shows statistics for all individually publishable antibiotics in terms of kilograms of antibiotic base (Kg) or billions of U.S.P. units (BU):

Antibiotic	Unit of quantity	Production	Sales		
			Quantity	Value	Unit value
				1,000 dollars	
Antifungal and antitubercular antibiotics, for medicinal use	----Kg----	517,790	349,128	18,973	$54.34

Tetracyclines, for all uses	----Kg----	2,268,502	...	...	...

[6] Production of all antibiotics for medicinal use amounted to 12,622,000 pounds.

[7] Production of all antibiotics for animal feeds and other nonmedicinal uses amounted to 8,212,000 pounds.

[8] Production of sulfonamides in 1973 was considerably larger than the 4,509,000 pounds shown in the cumulative total of the monthly reports because of 2 companies which did not report monthly data. In order to avoid disclosure, some of the previously unreported production is included in the figure shown for production of "all other anti-infective agents".

[9] Includes production of some sulfonamides (see footnote 8) and sales of antifungal agents.

[10] Includes production and sales of anticonvulsants, antitussives, general anesthetics, and stimulants; also includes sales of amphetamines, antidepressants, skeletal muscle relaxants, and tranquilizers.

Footnotes for table 1--Continued

[11] Sales of mercurial diuretics amounted to 170 pounds.

[12] All quantities for vitamins A, B_{12}, D, and E were reported in terms of grams or units, but were converted to pounds for inclusion in the main statistical table (1.317 billion units of vitamin A acetate, 0.824 billion units of vitamin A palmitate, 453.6 grams of vitamins B_{12}, 18.14 billion units of vitamin D, 617,000 units of d-alpha tocopheryl acetate, 454,000 units of dl-alpha tocopheryl acetate, etc. = 1 pound). The following tabulation shows statistics for vitamins D and E (vitamins A and B_{12} were not separately publishable) in terms of millions of international units (MU) or billions of U.S.P. units (BU), as appropriate:

Vitamin	Unit of quantity	Production	Sales		
			Quantity	Value	Unit value
				1,000 dollars	
Vitamin D	----BU----	288,795	195,789	2,318	$11.84

All other	----MU----	494,634	350,463	7,723	22.04

[13] Includes production and sales of antineoplastic agents, methionine, hydroxy analog, calcium salt, salicylic acid, smooth muscle relaxants, and unclassified medicinal chemicals; also includes production of "all other" hormones and sales of roentgenographic contrast media and "all other" hematological agents.

Flavor and Perfume Materials

Flavor and perfume materials are organic chemicals used to impart flavors and odors to foods, beverages, cosmetics and soaps. These aromatic chemicals are also utilized to neutralize or mask unpleasant odors in industrial processes and products as well as in consumer products.

Total domestic production of flavor and perfume materials in 1973 amounted to 117.0 million pounds (table 1).[1] Sales of these materials in 1973 amounted to 108.3 million pounds, valued at $108.5 million, compared with 90.5 million pounds, valued at $84.5 million in 1972. These totals do not include benzyl alcohol, which was previously included in flavor and perfume materials but will be shown in the miscellaneous cyclic section of the 1973 report. U.S. production of flavor and perfume materials in 1973 increased 17.0 percent over 1972, and the quantity of sales rose 19.6 percent.[2]

Production of cyclic flavor and perfume materials in 1973 amounted to 52.9 million pounds; sales amounted to 45.6 million pounds, valued at $66.2 million. The individual chemical in the cyclic group produced in the greatest volume in 1973 was methyl salicylate (6.8 million pounds).

U.S. output of acyclic flavor and perfume materials in 1973 amounted to 64.1 million pounds; sales of these materials amounted to 62.8 million pounds, valued at $42.3 million. Monosodium glutamate was by far the most important of the acyclic chemicals, and the individual flavor and perfume chemical produced in the greatest volume.

The report for 1973 has eliminated the previously separate section for "Essential oils, chemically modified". Chemicals previously listed under this heading have been distributed throughout the cyclic and acyclic groups.

[1] See also table 2 which lists these materials and identifies the manufacturers by codes. These codes are given in table 3.

[2] Data for benzyl alcohol were excluded from both years.

Plastics and Resin Materials

Plastics and resin materials are high molecular weight polymers which, at some stage in their manufacture, exist in such physical condition that they can be shaped or otherwise processed by the application of heat and pressure. Depending on the chemical composition, manufacturing process or intended use, the commercial products may contain plasticizers, fillers, extenders, stabilizers, coloring agents or other additives. Plastics materials may be molded, cast or extruded into semi-finished or finished solid forms. Resin materials may be in the form of solutions, pastes or emulsions for applications such as protective coatings, adhesives, or paper and textile treatment. These statistics also cover polyether and polyester polyols for urethanes which are not plastics materials themselves, but are precursors.

Statistics on U.S. production and sales of synthetic plastics and resin materials for 1973 are given in table 1.[1] U.S. production of plastics and resin materials in 1973 totaled 30,251 million pounds, or 16.7 percent more than the 25,921 million pounds produced in 1972. Sales in 1973 totaled 27,018 million pounds, valued at $5,347 million compared with 22,946 million pounds, valued at $4,258 million in 1972.

Thermosetting materials are those which harden with a change in composition in the final treatment so that they cannot again be softened by heat or solvents. U.S. production of thermosetting materials totaled 6,394 million pounds in 1973 compared with 4,484 million pounds in 1972. Production of the most important products in 1973 included phenolic resins (1,608 million pounds), amino (or urea and melamine) resins (1,442 million pounds), polyester resins (899 million pounds), and alkyd resins (734 million pounds).

For the first time, the Trade Commission has estimated the urethane foam (flexible and rigid) market. The estimate is based on one of the starting materials, polyether and polyester polyols for urethanes (see table 1, footnote 10).

Thermoplastic materials are those which can be repeatedly softened by heat and shaped. U.S. production of thermoplastic materials totaled 23,856 million pounds in 1973 compared with 21,437 million pounds in 1972. Production of the most important products in 1973 included polyethylene (8,582 million pounds), vinyl resins (5,522 million pounds), and styrene type materials (5,156 million pounds).

This year the Trade Commission has broken out a new family of thermoplastic materials, the engineering plastics (see table 1, footnote 17).

[1] Calculated from rounded figures.

[2] Dry weight basis unless otherwise specified. Dry weight basis is the total weight of the materials including resin and coloring agents, extenders, fillers, plasticizers, and other additives, but excluding water and other liquids diluents unless they are an integral part of the materials.

[3] Includes benzenoid plastics and resin materials as defined in part 1 of schedule 4 of the Tariff Schedules of the United States.

[4] Polyester resins are unsaturated alkyd resins, later to be copolymerized with a monomer (such as styrene or methyl methacrylate); and polyallyl resins (such as diallyl phthalate and diglycol carbonate). Data are on an "as sold" basis, including monomer if part of the resin system.

[5] Due to a reporting error, both production and sales of unsaturated polyester resins were overstated by between 5 percent and 10 percent in the 1972 Synthetic Organic Chemical report.

[6] "Alkyd copolymers","styrene polyesters" and "styrenated alkyds" have been suggested as alternative names by industry sources.

[7] Due to a reporting error, the production and sales data for urea resins in the 1972 Synthetic Organic Chemical report was understated by about 5 percent. In addition, the average unit value reported by the Trade Commission for urea resins in 1972 was in error; the correct unit value was approximately 9 cents per pound.

[8] Includes reactive diluents which are an integral part of the resin. Excludes the weight of hardeners sold in association with the resin as part of a two-component system.

[9] Data shown for modified epoxy resins are that part of the unmodified epoxy resins which is further processed; therefore, the totals in parentheses are not included in the grand total. Henceforth the term "advanced" epoxy will not be used in order to avoid confusion in reporting.

[10] In view of the very large number of producers of both flexible and rigid urethane foams, these data are not collected as such by the Trade Commission. Urethane foams are described by industry sources as those urethane products which have a density below 15 pounds per cubic foot. Industry sources have estimated that flexible urethane foams accounted for 75 percent of the total 1973 consumption of polyether and polyester polyols for urethanes; the polyols are one of the two major starting materials used in the manufacture of these foams. In order to obtain the approximate total production data for flexible urethane foams, it is necessary to apply a factor of 1.5 to the production of urethane polyols. These same industry sources estimated that in 1973 rigid urethane foams represented 20% of the total consumption of polyols for urethanes, and that a factor of 2.5 should be used to determine the approximate total output for rigid urethane foams. The remaining 5 percent of production of polyols for urethanes is consumed in elastomers (synthetic rubbers) and in solid urethane plastics (e.g., coatings, surface coatings, etc.). The estimated production of both flexible and rigid urethane foams for 1973 is as follows: Flexible foams (1,161,036 thousand pounds x .75 x 1.5)=1,306,165 thousand pounds and rigid foams (1,161,036 thousand pounds x .20 x 2.5)=580,158 thousand pounds.

Urethane elastomers, the other end-use product derived from these polypols for urethanes, are reported in the elastomers (synthetic rubbers) section of the Synthetic Organic Chemicals report.

In addition to the polyols, the other principal starting materials used in the production of urethane products are the isocyanic acid derivatives, mainly the 80/20 mixture of toluene-2,4- and 2,6-diisocyanate. Statistics for the isocyanic acid derivatives are reported in the cyclic intermediates section of the Synthetic Organic Chemicals report.

[11] Most of the increase in production and sales of polyols for urethanes in 1973 over 1972 resulted from a more thorough coverage of this industry by the Trade Commission.

Footnotes for table 1--Continued

[12] Includes glyoxal resins, polybutadiene resins, toluenesulfonamide resins, and other thermosetting resins and their precursors.
[13] Does not include production or sales for fiber use.
[14] Includes data for acrylic resins reported to the Trade Commission under thermosetting resins.
[15] The production and sales data reported in the 1972 Synthetic Organic Chemicals report for cellulosic plastics and resins were overstated by about 11 percent due to a reporting error. Production and sales data are virtually identical for both 1972 and 1973.
[16] Significantly under-reported in 1972 due to misclassification.
[17] Engineering plastics: Acetals, polycarbonate, polyimide, polysulfone, and polyphenylene oxide. Engineering plastics are defined in Whittington's Dictionary of Plastics, (First edition, published by Technomic Publishing Co., Inc.), as "those [plastics] which have mechanical, chemical and thermal properties suitable for use in construction, machine components and chemical processing equipment". The above list of plastics (all of which are thermoplastic) was selected from a larger group in this source. The other plastics named in Whittington's Dictionary as engineering plastics, ABS resins and nylon resins, are not included in the above list as they are published separately.
[18] Includes data for petroleum hydrocarbon resins reported to the Trade Commission under thermosetting resins.
[19] Statistics for nylon 6 and nylon 6/6 which are used in plastic applications (e.g., molding, etc.) are included here.
[20] Statistics for polyethylene terephthalate which is used in plastic applications (e.g., molding, etc.) are included here.
[21] The increase in both production and sales of saturated polyester resins in 1973 over 1972 is due in part to more complete industry coverage by the Trade Commission.
[22] Includes data for ethylene copolymers which could be published separately. The reason statistics for the copolymers are not reported separately is that there is no accepted industry definition of when a homopolymer ends and a copolymer begins. Ethylene accounts for 50 percent or more (by weight) of these copolymers. The low-density polyethylene copolymers includes those produced from ethylene and other non-hydrocarbon co-monomers (e.g., vinyl acetate, ethyl acetate, and acrylic acid). While the high-density copolymers includes those produced from ethylene and other hydrocarbon monomers (e.g., butene or hexene).
[23] Includes data for polystyrene resins reported to the Trade Commission under thermosetting resins.
[24] Data are on the basis of dry resin content, excluding the weight of plasticizers, extenders, fillers, coloring agents, stabilizers or impact modifiers, unless otherwise noted.
[25] Partially estimated in order to avoid possible disclosure.
[26] Data for polyvinyl acetate produced and sold in latex form includes the weight of any protective colloids which are used as emulsion stabilizers and form an integral part of the resin system. Production and sales do not include polyvinyl acetate used as a reactive intermediate for polyvinyl alcohol or other vinyl resins.
[27] Production and sales do not include polyvinyl alcohol used as a reactive intermediate for polyvinyl butyral or other vinyl resins.
[28] Incudes polyvinyl butyral, polyvinyl formal, polyvinylidene chloride (solid resin), and other vinyl resins
[29] Includes fluorocarbon resins except PTFE, α-methylstyrene resins, phenoxy resins, polybutylene type resins, polyphenylene sulfide type resins, polyterprene resins, and other thermoplastics materials.
[30] Decline in the production and sales of all other thermoplastic resins is due mainly to the break-out of a new category, engineering plastics.

Note.--Data reported to the Trade Commission do not necessarily coincide with that reported to the Society of the Plastics Industry (i.e., SPI) due to differences in both the reporting instructions (e.g., polyamide resins, nylon type) and in the coverage (e.g., phenolic resins).

Rubber-Processing Chemicals

Rubber-processing chemicals are organic compounds that are added to natural and synthetic rubbers to give them qualities necessary for their conversion into finished rubber goods. In this report, statistics are given for cyclic and acyclic compounds by use--such as accelerators, antioxidants, blowing agents, and peptizers. Data on production and sales of rubber-processing chemicals in 1973 are given in table 1.[1]

Production of rubber-processing chemicals as a group in 1973 amounted to 401 million pounds, or 11.1 percent more than the 361 million pounds reported for 1972. Sales of rubber-processing chemicals in 1973 amounted to 312 million pounds, valued at $199 million, compared with 280 million pounds, valued at $178 million, in 1972. The increased production and sales of rubber-processing chemicals in 1973 is attributable principally to the increased production and sales of cyclic antioxidants, antiozonants, and stabilizers.

The production of cyclic rubber-processing chemicals in 1973 was 338 million pounds, or about 9.2 percent more than the 310 million pounds reported for 1972. Sales in 1973 were 264 million pounds, valued at $176 million, compared with 240 million pounds, valued at $158 million, in 1972. Of the total production of cyclic rubber-processing chemicals in 1973, accelerators accounted for 32.1 percent and antioxidants for 63.3 percent. Production of antioxidants, which amounted to 214.3 million pounds in 1973, included 138.0 million pounds of amino compounds and 76.3 million pounds of phenolic and phosphite compounds. Sales of amino antioxidants in 1973 were 109.4 million pounds, valued at $73.2 million; sales of phenolic and phosphite antioxidants were 54.1 million pounds, valued at $30.1 million.

Production of acyclic rubber-processing chemicals in 1973 amounted to 62.6 million pounds, an increase of 22.4 percent from the 51.1 million pounds reported for 1972. Sales in 1973 totaled 48.1 million pounds, valued at $23.7 million, compared with 40.2 million pounds, valued at $19.7 million, in 1972. Accelerators accounted for 55.7 percent of the production of acyclic rubber-processing chemicals in 1973 and dodecyl mercaptans accounted for 33.5 percent.

Elastomers

Elastomers (synthetic rubbers) are high polymeric materials with properties similar to those of natural rubber. The term "elastomers" as used in this report, means a substance, whether in bale, crumb, powder, latex, and other crude form, which can be vulcanized or similarly processed into a material that can be stretched to at least twice its original length and, after having been so stretched and the stress removed, will return with force to approximately its original length. U.S. production and sales of elastomers in 1973 are shown in table 1.[1]

Production and sales quantities for styrene-butadiene (S-type rubber) are reported beginning in 1973 on a basis which includes the oil content of oil-extended forms, whereas in previous years they were reported on an elastomer-content-only basis. This change has the effect of increasing the quantity levels of production and sales for S-type and total elastomers above those reported on the former basis, and of decreasing the unit values for these two categories.

Total U.S. production of synthetic rubber in 1973 amounted to 5,990 million pounds. If reported on the same basis as for 1972, total U.S. production of elastomers in 1973 would amount to 5,404 million pounds and would represent an increase of 10 percent over the total production reported for 1972. Total sales of elastomers in 1973 amounted to 5,159 million pounds, which, if reported on the former basis, would amount to 4,670 million pounds, an increase of 13 percent above sales reported for 1972.

Syrene-butadiene rubber (SBR, or S-type rubber) in 1973 continued to be the elastomer produced in the greatest quantity as it has been for more than a quarter of a century. U.S. production of S-type rubber, including 38 million pounds of its vinylpyridine sub-type, amounted to 3,335 million pounds in 1973. If reported on the same basis as in 1972, production of S-type rubber in 1973 would be 2,749 million pounds, an increase of 4 percent above that reported for 1972. Solution polymerized butadiene rubber, a stereo type elastomer, was produced domestically in 1973 in the next largest amount--783 million pounds; production of isoprene and ethylene-propylene rubbers, the other stereo types, amounted to 265 million and 264 million pounds, respectively. Total U.S. production of these stereo type elastomers amounted to 1,312 million pounds in 1973--an increase of 13 percent over 1972. Other principal types of synthetic elastomers for which U.S. production data are reported separately are isobutylene-isoprene (butyl) rubber, production of which was 352 million pounds in 1973, and acrylonitrile-butadiene (N-type) rubber, production of which was 193 million pounds.

Sales of S-type rubber by U.S. producers in 1973 (including its vinyl-pyridine sub-type) amounted to 2,840 million pounds, which, if reported on the same basis as in 1972, would amount to 2,351 million pounds, an increase of 10 percent above sales reported for 1972. Sales of stereo-type elastomers in 1973 amounted to 995 million pounds. In the latter category, sales of solution polymerized butadiene rubber amounted to 515 million pounds, sales

of isoprene type rubber to 253 million pounds, and those of ethylene-propylene rubber of 227 million pounds. Sales of N-type rubber in 1973 amounted to 166 million pounds. The increase in 1973 sales over those of 1972 for the stereo-and N-type rubbers ranged from 6 percent for the isoprene type to 24 percent for the ethylene-propylene type; the increase for the butadiene type was 11 percent and for N-type 23 percent.

[1] See also table 2 which lists these products and indicates the manufacturers of each by code. The codes are identified by company name in table 3.

[1] The term "elastomers" is defined as substances in bale, crumb, powder, latex, and other crude forms which can be vulcanized or similarly processed into materials that can be stretched at 68°F. to at least twice their original length and, after having been stretched and the stress removed, will return with force to approximately their original length.

[2] Includes oil content of oil-extended elastomers. (See note).

[3] Calculated from rounded figures.

[4] The data on urethane elastomers are believed to be not fully representative of the total urethane market in view of the very large number of urethane elastomer producers. An estimate of the total market can be made by applying a factor to sales of polyether and polyester polyols used in the manufacture of polyurethanes. (Data for such estimates will appear in the section on plastics and resin materials to be published later this year).

[5] Includes production and sales data for acrylic ester, polysulfide, chloroprene, epichlorohydrin, isobutylene, and butadiene emulsion elastomers, certain solution elastomers, carboxylated SBR latex, chlorosulfonated polyethylene, thermoplastic rubber, miscellaneous elastomers, and sales data for the isobutylene-isoprene type elastomer.

Note.--Production and sales data for styrene-butadiene (S-type) rubber were reported in previous years on an elastomer content basis. Beginning with this report (1973), such annual data will be reported on the basis of total weight including oil content; thus, the figures for production and sales quantities of S-type, as well as those of total elastomers, are somewhat larger than they would have been if reported on the former basis. The new basis of reporting also has the effect of lowering the unit value of both the S-type and total elastomers. If reported on the same basis as for 1972 and previous years, production and sales statistics, total and for styrene-butadiene (S-type) rubber, for 1973 would be as follows:

	Production	Sales		
		Quantity	Value	Unit value
	1,000 pounds	1,000 pounds	1,000 dollars	Per pound
Grand total	5,403,767	4,669,526	1,304,678	$0.28

Plasticizers

Plasticizers are organic chemicals that are added to synthetic plastics and resin materials to (1) improve workability during fabrication, (2) extend or modify the natural properties of these materials, or (3) develop new improved properties not present in the original material. Table 1 presents statistics on U.S. production and sales of plasticizers in as great as detail as is possible without revealing the operations of individual producers.[1]

U.S. production of plasticizers totaled 1,873 million pounds in 1973, an increase of 9.7 percent from the 1,708 million pounds reported for 1972. Sales of plasticizers totaled 1,708 million pounds, valued at $341 million, in 1973, compared with 1,637 million pounds, valued at $291 million, in 1972.

Production of cyclic plasticizers in 1973, which consisted chiefly of the esters of phthalic anhydride and phosphoric acid, amounted to 1,385 million pounds, an increase of 6.4 percent from the 1,302 million pounds reported for 1972. Sales of cyclic plasticizers in 1973 totaled 1,290 million pounds, valued at $205 million, compared with 1,273 million pounds, valued at $180 million, in 1972. The most important cyclic plasticizer was di(2-ethylhexyl) phthalate, with production of 378 million pounds, in 1972.

Production of acyclic plasticizers in 1973 totaled 488 million pounds, an increase of 20.1 percent from the 406 million pounds reported for 1972. Sales of acyclic plasticizers totaled 419 million pounds, valued at $136 million, in 1973, compared with 364 million pounds, valued at $110 million, in 1972. Epoxidized soya oils were the most important acyclic plasticizer in 1973, with production of 117 million pounds.

Surface-Active Agents

The surface-active agents included in this report are organic chemicals that reduce the surface tension of water or other solvents and are used chiefly as detergents, dispersing agents, emulsifiers, foaming agents, or wetting agents in either aqueous or nonaqueous systems. Waxes and products used chiefly as plasticizers are excluded. Surface-active agents are produced from natural fats and oils; from silvichemicals such as lignin, rosin, and tall oil; and from chemical intermediates derived from coal tar and petroleum. A major part of the output of the bulk chemicals shown in this report is consumed in the form of packaged soaps and detergents for household and industrial use. The remainder is used in the processing of textiles and leather, in ore flotation and oil-drilling operations and in the manufacture of agricultural sprays, cosmetics, elastomers, foods lubricants, paints, pharmaceuticals, and many other products.

The statistics for production and sales of surface-active agents are grouped by ionic class and by chemical class and subclass. All quantities are reported in terms of 100-percent organic surface-active ingredient and thus exclude all inorganic salts, water, and other diluents. Sales statistics reflect sales of bulk surface-active agents only; sales of formulated products are excluded.

Total U.S. production of surface-active agents in 1973 amounted to 4,372 million pounds, or 8.2 percent more than the 4,039 million pounds reported for 1972. Sales of bulk surface-active agents in 1973 amounted to 2,580 million pounds, valued at $532 million, compared with sales in 1972 of 2,258 million pounds, valued at $451 million. In terms of quantity, sales in 1973 were thus 14.3 percent larger than in 1972; in terms of value sales in 1973 were 18.0 percent larger than in 1972.

Production of anionic surface-active agents in 1973 amounted to 2,967 million pounds, or 68.0 percent of the total output reported for 1973 and 8.0 percent greater than the anionic output reported for 1972. Sales of anionics in 1973 amounted to 1,519 million pounds, valued at $228 million. Of the total anionic output, 922 million pounds consisted of potassium and sodium salts of fatty, rosin, and tall oil acids, of which 528 million pounds consisted of the potassium and sodium salts of tallow acids and 139 million pounds was the sodium salt of coconut oil acids; 678 million pounds consisted of alkylbenzenesulfonates, of which 374 million pounds was sodium dodecylbenzenesulfonate, 149 million pounds was dodecylbenzenesulfonic acid, and 120 million pounds was sodium tridecylbenzenesulfonate; 689 million pounds consisted of ligninsulfonates, of which 462 million pounds was the calcium salt; and 220 million pounds consisted of sulfated ethers.

Production of nonionic surface-active agents in 1973 amounted to 1,124 million pounds, or 25.7 percent of the total output reported for 1973

572-698 O - 75 - 11

and 7.2 percent more than the nonionic output reported for 1972. Sales of nonionics in 1973 amounted to 834 million pounds, valued at $202 million. Of the total nonionic output, 283 million pounds consisted of benzenoid ethers, of which 152 million pounds was nonylphenol ethoxylate; 501 million pounds consisted of alcohol ethoxylates and other nonbenzenoid ethers, of which 377 million pounds was mixed linear alcohols ethoxylates; 110 million pounds consisted of glycerol esters; and 94 million pounds consisted of alkanolamides.

Production of cationic surface-active agents in 1973 amounted to 260 million pounds, or 5.9 percent of the total output reported for 1973 and 13.5 percent greater than the cationic output reported for 1972. Sales of cationics in 1973 amounted to 207 million pounds, valued at $89 million Of the total cationic output, 83 million pounds consisted of quaternary ammonium salts not containing oxygen, and 84 million pounds consisted of amines not containing oxygen.

Production of amphoteric surface-active agents in 1973 amounted to 21.1 million pounds, or 0.5 percent of the total output reported for 1973 and 46.5 percent greater than the amphoteric output reported for 1972. Sales of amphoterics in 1973 amounted to 19.6 million pounds, valued at $13.2 million.

The difference between production and sales reflects inventory changes and captive consumption of soaps and surface-active agents by synthetic rubber producers, and by manufacturers of cosmetics, packaged detergents, bar soaps, and other formulated consumer products. In some instances the difference may also reflect quantities of surface-active agents used as chemical intermediates, e.g., nonionic alcohol and alkylphenol ethoxylates which may be converted to anionic surface-active agents by phosphation or sulfation.

Pesticides and Related Products

Pesticides and related products include fungicides, herbicides, insecticides, rodenticides, and related products such as plant hormones, seed disinfectants, soil conditioners, soil fumigants, and synergists. The data are given in terms of 100-percent active material; they thus exclude such materials as diluents, emulsifiers, and wetting agents.

U.S. production of pesticides and related products in 1973 amounted to 1,289 million pounds--11.3 percent greater than the 1,158 million pounds reported for 1972 (table 1).[1] Sales in 1973 were 1,199 million pounds, valued at $1,344 million, compared with 1,022 million pounds, valued at $1,092 million, in 1972.

The output of cyclic pesticides and related products amounted to 910 million pounds in 1973--8.4 percent greater than the 839 million pounds produced in 1972. Sales in 1973 were 852 million pounds, valued at $1,091 million, compared with 720 million pounds, valued at $890 million in 1972. Production of acyclic pesticides and related products in 1973 amounted to 379 million pounds, compared with 318 million pounds reported for 1972, an increase of 19.1 percent. Sales in 1973 were 347 million pounds, an increase of about 15.0 percent, as compared to the 302 million pounds reported in 1972; the value of sales was $252 million in 1973, compared with $202 million in 1972--an increase of 24.9 percent.

[1] See also table 2 which lists these products and identifies the manufacturers by codes. These codes are given in table 3.

Miscellaneous Chemicals

The term miscellaneous chemicals comprises those synthetic organic products that are not included in the use groups covered by the other preliminary reports in the 1973 series. They include products that are employed in a great variety of uses. The number of chemicals used exclusively for only one purpose is not large. Among the products covered are those used for gasoline and lubricating oil additives, paint driers, photographic chemicals, tanning materials, flotation reagents, refrigerants, textile polymers, sequestering agents, organic fertilizers, antifreeze chemicals, solvents, and acyclic intermediates. This report presents statistics on U.S. production and sales of miscellaneous chemicals in as great detail as is possible without revealing the operations of individual producers.

Production of miscellaneous cyclic and acyclic chemicals in 1973 totaled almost 99 billion pounds, or 9.4 percent more than the output of 90.5 billion pounds reported for 1972. Sales of miscellaneous chemicals in 1973 amounted to 49.7 billion pounds, valued as $5.3 billion, compared with 45.2 billion pounds, valued at $4.7 billion in 1972.

The total output of miscellaneous cyclic chemicals in 1973 was 3.2 billion pounds. Sales in 1973 totaled 1.5 billion pounds, valued at $523 million. In 1973, the most important cyclic compound was polyethylene terephthalate, the output of which was 1.7 billion pounds. The lubricating oil and grease additives group output increased significantly, from 388 million pounds in 1972 to 535 million pounds in 1973.

Total production of miscellaneous acyclic chemicals in 1973 was 95.7 billion pounds, or 8.7 percent more than the output of 88.1 billion pounds reported for 1972. Sales in 1973 totaled 48.2 billion pounds, valued at $4.8 billion, compared with 44.0 billion pounds, valued at $4.3 billion, in 1972. The statistics for acyclic chemicals are grouped primarily by chemical function. The order of precedence of these functional groups is generally that used in naming and indexing chemical compounds by Chemical Abstracts, but other important considerations are comparability with other statistics and the need for groupings that will not reveal the operations of individual producers.

In 1973, the most important groups of acyclic chemicals were the halogenated hydrocarbons, the nitrogenous compounds, monohydric alcohols, and aldehydes and ketones. Production of halogenated hydrocarbons, which are used as solvents, intermediates, refrigerants, and aerosol propellants, totaled 22.6 billion pounds. The most important chemicals in this group were dichloroethane (production of 9.3 billion pounds in 1973, compared with 7.8 billion pounds in 1972) and vinyl chloride (5.4 billion pounds

in 1973, compared with 5.1 billion pounds in 1972). Output of nitrogenous compounds totaled 17.0 billion pounds. The most important chemical in this group was urea (used principally in fertilizers and as a feed additive), production of which was 7.1 billion pounds in 1973 and 6.9 billion pounds in 1972.

Monohydric alcohols, which are used largely as solvents and intermediates, were the third largest group in 1973, with production of 14.9 billion pounds. The most important items in the group in terms of production were synthetic methanol (7.1 billion pounds in 1973, compared with 6.5 billion pounds in 1972), synthetic ethyl alcohol (2.0 billion pounds in 1973, compared with 1.8 billion pounds in 1972) and isopropyl alcohol (remaining at the 1.8 billion pound level in 1973). Aldehydes and ketones, which are also used largely as solvents and intermediates, were the next largest group with production of 12.2 billion pounds. The most important items in this group in 1973 were formaldehyde (6.4 billion pounds) and acetone (2.0 billion pounds).

Footnotes for table 1

[1] Calculated from rounded figures.
[2] Not available.
[3] Statistics exclude production and sales of tricresyl phosphate. Statistics on tricresyl phosphate are given with "Plasticizers."
[4] Quantities are given on the basis of solid naphthenate, tallate or linoleate content.
[5] Statistics exclude production and sales of copper naphthenate. Statistics on copper naphthenate are given with "Pesticides and Related Products."
[6] Ethylcellulose which was formerly included with cellulose ethers is now included with cellulosic plastics materials.
[7] Statistics exclude production and sales of fatty amines. Statistics on fatty amines are given with "Surface-Active Agents."
[8] Production of urea in primary solution totaled 7,270,732 thousand pounds.
[9] Includes estimated values for sales of urea in nitrogen compounds.
[10] Statistics exclude production and sales of potassium and sodium stearates. Statistics on these stearates are included with "Surface-Active Agents."
[11] Statistics on production of ethyl alcohol from natural sources by fermentation are issued by the Department of Treasury, Bureau of Alcohol, Tobacco, and Firearms.
[12] Some polyols which are used as intermediates for urethanes have been included with "Plastics and Resin Materials."
[13] Production totals may be understated because some methyl chloride and ethylene dichloride is produced but not separated or accurately measured (and therefore not reported) by some producers.

APPENDIX

U.S. IMPORTS OF BENZENOID CHEMICALS AND PRODUCTS

U.S. general imports of benzenoid chemicals and products entered under the Tariff Schedules of the United States (TSUS), schedule 4, part 1, subparts B and C are analyzed by the U.S. International Trade Commission annually and published in detail in a separate report.[1] General imports of benzenoid items entered in parts 1B and 1C totaled 390.6 million pounds with a foreign invoice value of $300.0 million in 1973 compared with 322.0 million pounds with a foreign invoice value of $246.7 million in 1972.

Benzenoid products that are "competitive" with similar domestic products, because they accomplish results substantially equal to those accomplished by the similar domestic product when used in substantially the same manner, are subject to a special basis of valuation for customs purposes known as the "American selling price." If "noncompetitive," the benzenoid products are valued for customs purposes on the basis of the "United States value." The essential difference between these two values is that "American selling price" is based on the wholesale price in the United States of the "competitive" domestic product, whereas "United States value" is based on the wholesale price in the United States of the imported product less most of the expenses incurred in bringing the product to the United States and selling it. When neither of these two valuation bases applies, then the "export value," "foreign value," or "constructed value" is used as the valuation basis under section 402 or 402a Tariff Act of 1930, as amended. The competitive status of benzenoid imports in 1973 is shown in table 2.

Industrial organic chemicals that are entered under part 1B consist chiefly of benzenoid intermediates and small quantities of acyclic compounds which are derived in whole or in part from benzenoid compounds. Also included are mixtures and small quantities of finished products not specially provided for in part 1C (e.g., rubber-processing chemicals). In terms of value, 39.2 percent of all the benzenoid imports under part 1B in 1973 came from West Germany; 19.2 percent, from Japan; 9.5 percent, from Switzerland; and 6.7 percent from Belgium.

Finished organic chemical products entered under part 1C include dyes, pigments, medicinals, flavor and perfume materials, pesticides, plastics materials, and certain other specified products. In terms of value 31.5 percent of all finished benzenoid imports under part 1C in 1973 came from West Germany; 18.4 percent, from switzerland; 16.9 percent, from the United Kingdom; and 10.4 percent from Japan.

Note:--The totals shown in this table differ from those given in the official statistics of the U.S. Department of Commerce chiefly because of differences in coverage and in the methods used in compiling the data. In general, the statistical coverage in 1973 varies from a low of 68 percent for flavors and perfumes to almost complete coverage for intermediates, dyes, pigments, and medicinals.
